

# Moving A Device To A New Container:

## How to move a device to the correct container in CommandIQ

Below image shows the Dashboard. Each little white box is called a container. It is possible that a device could be added to the wrong container or into the Other container when it is first connected. Containers with numbers have devices in them and the number indicates how many devices. Move to step 1.

1. Tap on the Computer container from the Dashboard to get into the screen shown below with the devices that are already labeled as a Computer.

Example here would be possibly a phone was accidentally added as a computer. You could tap on the phone and move it to the appropriate container by following steps 2 and 3.

2. Tap on the device listed in the previous image to get to the screen shown below. Below the graph is the device name. This can be changed if it does not make sense to you by tapping on the PENCIL icon on the right side of the image. If you want to change the container it is in, tap on the down arrow to the right of Computer to see all of the containers available.

3. Tapping on the down arrow brings you to the below image which shows you a list of all of the available containers to choose from. By tapping on a new container this device will be moved from the Computer container into the new container chosen. You should then see a message that the device was moved and tap OK.
